

Corn cob granulates are a completely natural and biodegradable product mainly composed by cellulose and obtained by grinding and pressing the cob.

The Follador firm deals with the **production** and **sale** of this product which is largely

utilised in the field of catering mainly for the **drying** and **polishing process** of **cutlery**. The cob is placed inside small and user-friendly machines whose vibrations allow the cob **granulates**

to remove, through friction, and absorb everything that nocks metal such as limestone and grease.

In order to obtain a perfect drying and **polishing effect** we supply sterilised abrasive granulates which are completely dusts-free. Beside saving time, the advantage of drying cutleries with corn cob is that it prevents the oxidation of silver and the opacification of steel so to have as good as new ever-polished cutleries.

This product is suitable for every kind of drying machine in the market.

The granulate measurements that are used for cutleries are the STOV16 and STOV20 whose use depends on the client's preferences and the machines available.
