

For more than fifty years the Follador firm deals with the **production** and **sale** of **corn cob** which is used in more than thirty different sectors all over the world. Our abrasive

granulates

are a high quality product characterised by quality and reliability which is the result of up-to-date technologies and experience.

Our firm deals with the **production** and **sale** of different granulate measures. Heavier **granulates** are

used, according to their characteristics, in different ways:

- because of their abrasive and liquid absorbing capacity there are used in the industrial sector for the vibratory finishing and sifting of metal surfaces; in the building trade and redecoration fields they are used for sandblasts and gritting of delicate metals, electric materials, wooden beams; in the catering industry they are used for the drying and polishing of cutleries; - thanks to their high absorbing capacity (due to their internal cellular structure) granulates are used as litters for pets in order to absorb and contain liquids;
- our vegetable granulates can be used either in the natural state or blended with a number of chemical substances according to the use, in both industrial and agricultural fields.

The production of the lighter part of the **corn cob** can also be applied in different fields:

- as ingredients for animal fodders due to the high level of fibres, as supplement for vitamins, insecticides, pesticide and as a fertiliser; - it is used in the foundry moulds and as a component of insulating materials.
